SUMM (i) 0.5-10 wt. % of a humectant for low temperature stability, e.g., a mono- or dialkylene glycol of up to eight carbon atoms, especially dipropylene glycol, and

SUMM (i) a humectant for low temperature stability, e.g., a mono- or dialkylene glycols of up to eight carbon atoms, especially dipropylene glycol, generally in amounts of from about 0.5 to about 10 wt. % and

SUMM . . . the oil-in-water emulsifying system is a known ingredient which is commercially available and is the benzoated derivative of a polyethylene glycol ether of glycerin.

SUMM . . . found that the use of a humectant to enhance low temperature stability such as for instance a mono- or dialkylene glycol of up to eight carbon atoms, which will preferably be dipropylene glycol, may be effectively employed in producing the preferred clear antiperspirant microemulsion of the present invention.

SUMM Generally speaking, the mono- or dialkylene glycol component may be effectively employed in amounts of from about 0.1 to about 10 wt. % and will preferably be. . .

DETD 1. In a suitable vessel, equipped with a homo-mixer, add the formula weight of antiperspirant active in solution, dipropylene glycol, deionized water and sodium chloride. Heat the solution with mixing to 110.degree. F.-120.degree. F.

DETD . . . % (W/W)

Aluminum Zirconium Tetrachlorohydrex Gly,
50.00

35% (Rezal 36 G Soln.) Reheis

PEG-7-glyceryl cocoate (Cetiol HE) Henkel

L11 ANSWER 1 OF 1 USPATFULL on STN

PI US 5487887 19960130 <--

SUMM . . . broadly discloses stable oil-in-water emulsion based compositions as containing an oil, water, and a nonionic three-component emulsifying system, each nonionic **surfactant** being present in stated concentrations and having a specific HLB requirement. While antiperspirant compositions are not specifically taught by this. . .

SUMM Witco Tech. Bull. Formula 101A is directed to a clear microemulsion antiperspirant composition containing a mixture of various nonionic **surfactants**. The composition has a viscosity of 500-5000 cps, and is stable at elevated temperatures.

SUMM (iii) less than 5 wt. % of a nonionic **surfactant** for high temperature stability, e.g., octoxynol-9 (Polyoxyethylene(9) Octyl Phenyl Ether or lauricdiethanolamidine;

SUMM (iii) less than 5 wt. % of a nonionic **surfactant** for high temperature stability, e.g., octoxynol-9 (Polyoxyethylene(9) Octyl Phenyl Ether) or lauricdiethanolamide;

SUMM . . . addition of an oil-in-water emulsifying system comprising a polyoxyethylene, polyoxypropylene block polymer in combination with glycereth-7-benzoate and a nonionic **surfactant** to provide high temperature stability may be effectively employed.

SUMM The nonionic **surfactant** component of the oil-in-water emulsifying system will generally be present in amounts less than 5 wt. % and will preferably. . . are also known commercially available materials as will be recognized by those skilled in the art. Preferably when the nonionic **surfactant** is octoxynol-9 or lauricdiethanolamide, this ingredient will be present in an amount of from about 1 to about 2 wt.. . .

CLM What is claimed is:

. . . in which the average values of x, y, and z are respectively 52, 35 and 52) glycereth-7-benzoate and a nonionic **surfactant**.

11. A composition according to claim 10, wherein the nonionic **surfactant** is selected from the group consisting of octoxynol-9 (polyoxyethylene (9) octyl phenyl ether) and lauricdiethanolamide.

. . . %; the glycereth-7-benzoate is present in an amount of from about 0.5 to about 2 wt. %, and the nonionic **surfactant** is present in a definite amount less than 5 wt. %.

L17 ANSWER 1 OF 1 USPATFULL on STN

AB Structured, **antiperspirant** microemulsions possibly in the form of liquid crystals, containing cosmetic oils, a solution of **antiperspirant** salt in a hydrophilic solvent, a surfactant and an oil structurant are provided. These microemulsions can be used in different types of Solid applicators such as soft solid and, particularly desirably, firm stick applicators. The structured microemulsions are preferably clear by virtue of a suitable choice of oil, solvent and structurant.

AB Disclosed are liquid **antiperspirant** compositions useful for both roll-on and aerosol **antiperspirant** applications. The compositions have reduced incidence of in-use skin irritation. The compositions comprise from about 10% to about 70%, by weight, of an **antiperspirant** active material, from about 1% to about 15%, by weight, of a suspension agent, from about 25% to about 75%, by weight, of a non-volatile silicone fluid component, and no more than about 15%, by weight, of volatile silicone fluid. In aerosol embodiments, the compositions can comprise the above composition as a concentrate in combination with an aerosol propellant.

AB An aerosol **antiperspirant** or **deodorant** composition free from anticholinergic compounds containing, as a non-staining emollient substance or dispersing agent, hexylene glycol. The compositions may be solutions or suspensions and may contain germicides and **antiperspirant** agents.

A preferred form of the invention is a powder aerosol **antiperspirant** composition containing hexylene glycol as the dispersing agent. The following formulation is typical of such compositions:

% by weight

Aluminium chlorhydrate	
	2 to 7.5
Colloidal silica bulking agent	
	0.05 to 0.75
Hexylene glycol	1 to 5
Hexachlorophene	up to 0.5
Perfume	0.01 to 2
Aerosol propellant	balance

The invention also relates to a process for making such a composition.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Disclosed are liquid **antiperspirant** compositions useful for both roll-on and aerosol **antiperspirant** applications. The compositions have reduced incidence of in-use skin irritation. The compositions comprise from about 10% to about 70%, by weight, of an **antiperspirant** active material, from about 1% to about 15%, by weight, of a suspension agent, from about 25% to about 75%, by weight, of a non-volatile silicone fluid component, and no more than about 15%, by weight, of volatile silicone fluid. In aerosol embodiments, the compositions can comprise the above composition as a concentrate in combination with an aerosol propellant.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB An aerosol **antiperspirant** or **deodorant** composition free from anticholinergic compounds containing, as a non-staining emollient substance or dispersing agent, hexylene glycol. The compositions may be solutions or suspensions and may contain germicides and **antiperspirant** agents.

A preferred form of the invention is a powder aerosol **antiperspirant** composition containing hexylene glycol as the dispersing agent. The following formulation is typical of such compositions:

% by weight

Aluminium chlorhydrate	2 to 7.5
Colloidal silica bulking agent	0.05 to 0.75
Hexylene glycol	1 to 5
Hexachlorophene	up to 0.5
Perfume	0.01 to 2
Aerosol propellant	balance

The invention also relates to a process for making such a composition.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L29 ANSWER 1 OF 1 USPATFULL on STN

TI Antiperspirant and deodorant compositions

PI US 3920807 19751118

<--

AB An aerosol **antiperspirant** or **deodorant** composition free from anticholinergic compounds containing, as a non-staining emollient substance or dispersing agent, hexylene glycol. The compositions may be solutions or suspensions and may contain germicides and **antiperspirant** agents.

AB A preferred form of the invention is a powder aerosol **antiperspirant** composition containing hexylene glycol as the dispersing agent. The following formulation is typical of such compositions:

SUMM This invention relates in a first aspect to an aerosol **antiperspirant** or doodorant composition, and in a second aspect to a process for making certain of the compositions.

SUMM . . . they dissolve not more than 5 percent of water at 70.degree.F. Examples of such materials are hydrophilic oils such as **hydrocarbon** oils exemplified by tetradecane; organic esters such as isopropyl myristate and glyceryl triolate; **alcohols** such as lauryl **alcohol**; carboxylic acids such as oleic acid and silicone oils such as the dimethylpolysiloxanes. As far as we are aware, only.

SUMM These aerosol **antiperspirant** compositions containing isopropyl myristate cause staining of clothing because of transfer of the composition from the skin to the clothing build-up of a deposit and discolouration of the deposit. This staining is particularly prevalent on clothing adjacent the **axillac**, for instance on shirts, blouses and brassieres.

SUMM It is an object of this invention to provide new aerosol **antiperspirant** and **deodorant** compositions which are substantially non-staining and yet which contain a substance having emollient properties to reduce the tendency of these.

SUMM It is also an object of this invention to provide substantially non-staining aerosol **antiperspirant** compositions containing dispersed, finely divided astringent metal salt.

SUMM It is a further object of this invention to provide new aerosol **antiperspirant** and **deodorant** compositions having a

- reduced tendency to build-up on clothing despite regular laundering.
- SUMM It is a still further object of this invention to provide new aerosol **antiperspirant** and **deodorant** compositions having a reduced tendency to stain clothing.
- SUMM Yet further objects of this invention are to provide new aerosol **antiperspirant** and **deodorant** compositions leaving a non-greasy film on the skin and to provide new aerosol compositions having **deodorant** activity without the use of conventional germicides.
- SUMM It is also an object of the invention to provide a process for preparing an aerosol **antiperspirant** composition containing aluminium chlorhydrate which avoids wastage of the chlorhydrate and facilitates easy dispersion of the chlorhydrate in the liquid.
- SUMM We have now discovered that these objects can be achieved by formulating an **antiperspirant** or **deodorant** composition using hexylene glycol as the substance having emollient and dispersing properties.
- SUMM Accordingly, in its broadest aspect the invention provides an aerosol **antiperspirant** or **deodorant** composition free from anticholinergic compounds comprising a solution of a substance having emollient properties in an aerosol propellant wherein the . . .
- SUMM In a second aspect the invention also provides an aerosol **antiperspirant** composition comprising a dispersion of a finely divided astringent metal salt in a solution of a substance having dispersing and emollient properties, in an aerosol propellant wherein the dispersing and emollient properties are imparted to the **antiperspirant** composition by the inclusion therein of from about 0.5 to 10 percent by weight of hexylene glycol whereby a substantially non-staining **antiperspirant** composition is obtained.
- SUMM Typically, a so-called powder **antiperspirant** composition according to the invention consists essentially of from 0.2 to 10 percent, preferably 2 to 7.5 percent by weight. . .
- SUMM Although the use of hexylene glycol produces an **antiperspirant** composition which is a great improvement over known products certain difficulties can occur during commercial manufacture of the composition. This. . .
- SUMM Accordingly, in a second aspect of this invention there is provided a process for preparing an aerosol **antiperspirant** composition which contains finely divided aluminium chlorhydrate dispersed in a solution of hexylene glycol in an aerosol propellant and which. . .
- SUMM c. combining said slurry with an aerosol propellant to form an aerosol **antiperspirant** composition.
- SUMM The physical form of the aerosol **deodorant** and **antiperspirant** compositions of the invention may be that of the so-called powder **antiperspirant** or it may be an aqueous, alcoholic or aqueous/alcoholic solution. In one form, an **antiperspirant** composition according to the invention comprises from about 1 to about 75 percent by weight of a C.sub.1 -C.sub.4 alcohol and an alcohol-soluble **antiperspirant** agent.
- SUMM Any one of the large number of materials which have been proposed for use as astringent **antiperspirant** agents may be used in the compositions of this invention although, in the case of powder **antiperspirant** compositions, the **antiperspirant** agent should be capable of formulation as a dispersion in the **antiperspirant** medium. Thus any **antiperspirant** agent which is soluble in the commonly used aerosol propellants referred to below is excluded from use in these compositions. . .
- SUMM Examples of suitable **antiperspirant** agents containing the zinc ion are zinc chloride, zinc sulfate, zinc sulfocarbolate and zinc stearate.

- SUMM Iron and **zirconium** salts may also be used for example ferric chloride and **zirconium** (IV) sulfate.
- SUMM Astringent metal salts and in particular aluminium salts are preferred as the **antiperspirant** agents of the invention. Most preferred is finely divided aluminium chlorhydrate. Grades of aluminium chlorhydrate which we have found particularly.
- SUMM **Antiperspirant** compositions of the solution type referred to above preferably contain an **alcohol-soluble antiperspirant** agent which is a complex salt of aluminium. Another **alcohol-soluble antiperspirant** agent which is particularly useful is zinc phenolsulphonate.
- SUMM Powder aerosol **antiperspirants** commonly contain a bulking agent to help prevent irreversible settling of the finely-divided astringent metal salt and to ease its.
- SUMM Optionally the **antiperspirant** compositions of the invention may contain a germicide. If a germicide is included then it will be in an amount. . . the degree of its germicidal activity. However, we have discovered that hexylene glycol itself can provide the composition with slight **deodorant** activity and so the use of a germicide is not obligatory.
- SUMM . . . others outside these classes may be used: the halogenated salicylanilides, halogenated carbanilides, halogenated phenols and bis-phenols, sodium C.sub.5 -C.sub.12 alkylbenzoylacrylates, **quaternary** ammonium compounds, thiuram sulfides, dithiocarbamates, halogenated diphenyl ethers, halogenated anilides of thiophene carboxylic acids and esters of hydroxybenzoic acids.
- SUMM Although, as stated above, any suitable germicide can be used in the **antiperspirant** compositions of the invention, we prefer to use hexachlorophene, chlorhexidine, dichlorophene, and **quaternary** ammonium compounds such as cetyltrimethyl ammonium bromide.
- SUMM The **antiperspirant** and **deodorant** compositions can contain perfumes in conventional amounts, for example 0.01 to 2 percent.
- SUMM Typical of the halogenated **hydrocarbons** which can be used are the following compounds: trichlorofluoromethane, dichlorodifluoromethane and symmetrical dichlorotetrafluoroethane.
- SUMM Petroleum **hydrocarbons** such as propane and isopropane, n-butane and isopentane may also be used.
- SUMM As stated above in the process of manufacture of an aerosol **antiperspirant** composition according to the invention formulated with aluminium chlorhydrate as the astringent metal salt it is preferable to include a . . .
- SUMM The surfactant should be both soluble in the **antiperspirant** medium which consists essentially of a solution of hexylene glycol in an aerosol propellant and chemically compatible with the other. . . of the surfactant is not critical to the invention. Some suitable surfactants for use in the process and powder aerosol **antiperspirant** compositions of the invention are described in "Surface Active Agents and Detergents" by A. M. Schwartz, W. Perry and J. . . .
- SUMM Amongst those **cationic surfactants** which are suitable for use in the process and compositions of the invention are the **quaternary ammonium** salts as cetyl trimethyl ammonium chloride and stearyl dimethyl benzyl ammonium bromide.
- DETD This example illustrates a typical process for preparing an aerosol **antiperspirant** composition containing **aluminum** chlorhydrate and a formulation of such an **antiperspirant**.
- DETD . . . parts of a pyrogenic silica are then suspended in the solution and, after thorough mixing, 35 parts of finely divided **aluminum** chlorhydrate are added and mixed in to form a slurry.
- DETD . . . way is dispensed into an aerosol unit and a propellant is added by the throughbutton filling method to form an **antiperspirant** according to the invention having the following composition:

DETD % by weight

Aluminum chlorhydrate	3.1
Pyrogenic silica	0.1
Hexylene glycol	1.8
Hexachlorophene	0.1
Perfume	0.4
Propellant 11	61.6
Propellant 12	32.7
Surfactant	0.2

- DETD This is a comparative example of a prior art aerosol **antiperspirant** composition containing isopropyl myristate.
- DETD This experiment was performed to demonstrate that an aerosol **antiperspirant** of the formula in Example 3 is less easily transferred to clothing than is one of the formula in EXAMPLE.
- DETD . . . was sprayed from a standard distance and for 2 seconds onto the inner side of the forearm so that the **antiperspirant** composition covered a circular area of about 5 cm in diameter. The composition was allowed 2 minutes to dry, after. . . 500 g. weight. After 15 minutes the weight was removed and the cotton was weighed to discover the amount of **antiperspirant** transferred from the skin.
- DETD Aerosol **antiperspirant** of Example 2
4.0 mg/cm.sup.2
- Aerosol **antiperspirant** of Example 3
0.5 mg/cm.sup.2
- DETD . . . result indicates the reduction in transfer from skin to clothing which is produced when the isopropyl myristate in an aerosol **antiperspirant** is replaced by hexylene glycol.
- DETD A similar experiment to that described in the previous example was performed with an aerosol **antiperspirant** composition having the following composition.
- DETD The addition of the nonionic surfactant did not affect the transference properties of the **antiperspirant** containing hexylene glycol.
- DETD The following experiment was performed to demonstrate the ease with which an aerosol **antiperspirant** of the formula in Example 5 can be removed from a fabric compared with an **antiperspirant** of the formulation in Example 2.
- DETD Each **antiperspirant** was sprayed onto a separate portion of the flexor surface of the forearm for 2 seconds so that the composition. .
- DETD This result shows that an **antiperspirant** formulated with hexylene glycol according to the invention is more easily removable from fabric by washing than is a conventional **antiperspirant** formulated as in Example 2 with isopropyl myristate. It was not possible to carry out the experiment over more than. . . left on the fabric after, say, five spray-wash cycles is very considerably greater in the case of an isopropyl myristate-containing **antiperspirant** than in the case of a hexylene glycol-containing one according to this invention. The build-up of unremovable product leads to. . .
- DETD This experiment was performed to demonstrate the difference between an **antiperspirant** formulated according to the invention and one formulated with isopropyl myristate as regards the stain which they produce in everyday. . .
- DETD The experiment involved a panel of four persons. Each person was supplied with samples of the **antiperspirant** of Example 2 and of the **antiperspirant** of Example 5. Two of the persons used the **antiperspirant** of Example 2 on the left arm and that of Example 5 on the right whilst in the case of the two remaining persons the **antiperspirants** were used in the opposite way.
- DETD The persons were asked to apply the **antiperspirants** at home

before wearing a white shirt which was supplied to them. Clean shirts were provided daily, a total of . . .

DETD Average Staining Index

No of Wash/wear

Cycles	Antiperspirant of	
	Example 2	Example 5
0	0	0
2	1.40	0.15
4	2.70	0.45
6	2.95	1.30

Person	Antiperspirant of	
	Example 2	Example 5

A	Before washing	
	83.8	83.6
	After washing/wearing	
	72.2	78.6
B	Before washing	
	83.5	83.3
	After washing/wearing	
	74.0	

DETD Both methods of assessing the staining produced by the two **antiperspirants** show that the formulation of Example 5, that is the one containing hexylene glycol according to the invention, produces less. . . .

DETD This example illustrates an aerosol **deodorant** composition according to the invention.

DETD This example illustrates an aerosol **antiperspirant** composition according to the invention containing an **alcohol-soluble antiperspirant agent**.

DETD

% by weight

Aluminum chlorhydrate/propylene	
	8.0
glycol complex	
Industrial methylated spirit	
	38.9
Hexylene glycol	3.0
Hexachlorophene	0.1
Propellant 114	20.0
Propellant 12	30.0

DETD This example illustrates an aerosol **deodorant** composition suitable for feminine intimate hygiene purposes.

DETD In the following experiment the staining produced by the aerosol **deodorant** of Example 8 was compared with that produced by a prior art aerosol having the composition:

DETD . . . & D were sprayed at a distance of four inches and for 2 seconds two, A and B, with the **deodorant** of Example 8 and the other two, C and D, with the prior art composition. Each square was allowed to. . . .

DETD . . . the reduction in staining which is obtainable by replacing the conventional fatty emollient such as isopropyl myristate in an aerosol **deodorant** composition with hexylene glycol. Had the tests been performed with coloured material, much more pronounced staining would have occurred with. . . .

DETD In this experiment, the staining produced by the solution

antiperspirant of Example 9 was compared with that produced by a prior art aerosol having the composition:

	% by weight
DETD	

glycol complex	
Isopropyl myristate	3.0
Industrial methylated spirit	38.9
Hexachlorophene	0.1
Propellant 114	20.0
Propellant 12	30.0

DETD . . . composition containing isopropyl myristate as the emollient substance whereas there was no noticeable staining on the squares sprayed with the **antiperspirant** of Example 9. After the fourth spray/wash cycle a very pronounced stain had appeared on the former squares, consisting of. . .

DETD The following are further examples of aerosol powder **antiperspirant** formulations according to the invention having satisfactory low-staining characteristics.

DETD The hexachlorophene in Example 3 is omitted and the amount of propellant is proportionately increased. This provides an acceptable **antiperspirant** composition exhibiting **deodorant** properties.

DETD . . . amounts should not be so large as to detract from the overall non-staining character of the compositions. When a powder **antiperspirant** composition contains a small amount of isopropyl myristate we prefer it also to contain a polyalkylene glycol as described in. . .

CLM What is claimed is:

1. In an aerosol **antiperspirant** composition comprising from about 0.2 to 10 weight percent of a finely divided astringent salt selected from the group consisting of zinc, **aluminum**, iron and **zirconium**, from about 0.01 to about 2.0 weight percent of a bulking agent having a bulk density of lower than about. . .

AB An aqueous alkaline cleaner and process for cleaning aluminum and tin surfaces. The aqueous alkaline cleaning solution includes

(A) at least one inorganic base;

(B) at least one cationic surfactant which is a quaternary ammonium compound; and

(C) water.

Aluminum and tin surfaces cleaned with the cleaning compositions are characterized by improved surface cleanliness and brightness.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB An aqueous alkaline cleaner and process are described for cleaning
aluminum and tin surfaces. The aqueous alkaline cleaning
solution comprises

(A) at least one inorganic base;

(B) at least one cationic surfactant which is a quaternary ammonium
compound; and

(C) water. Aluminum and tin surfaces cleaned with the cleaning

10/089,648

compositions of the present invention are characterized by improved surface cleanliness and brightness.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Dentrifrices including modified amino alkyl silicones are provided. The aminoalkyl silicones are modified with epoxides to alkylate the nitrogen atoms and decrease their reactivity to flavors and other aldehydes present in the dentifrice. The modified silicones form a hydrophobic layer on the teeth for prevention of caries and stain.

AB Structured, **antiperspirant** microemulsions possibly in the form
of liquid crystals, containing cosmetic oils, a solution of
antiperspirant salt in a hydrophilic solvent, a surfactant and
an oil structurant are provided. These microemulsions can be used in
different types of Solid applicators such as soft solid and,
particularly desirably, firm stick applicators. The structured
microemulsions are preferably clear by virtue of a suitable choice of
oil, solvent and structurant.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Compositions of matter comprising benzoate esters of hydroxyl terminated
polyether polysiloxane copolyols, in particular dimethicone copolyol
benzoates, and process for preparing same. The benzoate esters are
useful for personal care cleansing products, such as bar and liquid
soaps, skin and hair care products and textiles and fibers. The
compounds are prepared by reacting benzoic acid with hydroxyl terminated
polyether polysiloxane copolyols.

AB Polymer compositions, while providing suitable wrinkle control, also tend to dispense poorly when sprayed. The present invention shows that when viscosity of polymer compositions is minimized spray dispensing improves. Several approaches to minimizing the viscosity of polymer compositions are disclosed. Methods of controlling wrinkles in fabrics comprise treating fabrics with a variety of polymer compositions following a variety of methods. Articles of manufacture comprise (1) a container or substrate, (2) a wrinkle controlling composition, and (3) a set of instructions.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A liquid rinse-added fabric care composition that is characterized by at least two visually distinct phases when the composition is at rest and wherein at least one of the phases contains a fabric care agent is provided. The composition forms a temporary mixture when shaken that allows a consumer to dose a representative sample of the composition and spontaneously re-forms at least two visually distinct phases when allowed to remain at rest. The fabric care agents present in one or more phases of the composition may include fabric softener actives, color care agents, perfumes, antibacterial agents, malodor control agents, ultraviolet protection agents, anti-abrasion, anti-wear & fabric integrity agents, wrinkle control agents, and mixtures thereof. The composition should also contain less than about 5%, preferably less than about 3%, and even more preferably less than about 1% by weight of detergent actives. The composition optionally may contain an electrolyte, phase stabilizer, a phase separation inducing polymer and/or a solvent. Methods for delivering one or more fabric care benefits to a fabric during a laundering operation using the compositions are also disclosed. Methods for conveying information to a consumer concerning a multi-phase liquid rinse-added fabric care composition are also provided. An article of manufacture comprising a liquid rinse-added fabric care composition that has at least two visually distinct phases and a container that enables a consumer to view the visually distinct phases that are present in the composition is also described. Alternatively, the container may comprise a double walled cap and an insert for removing excess composition that may adhere to the cap.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The invention concerns clear o/w microemulsions comprising a perfume oil, an aqueous phase and one or more surfactants with HLB between 9 and 18, and co-surfactants of which at least 0.5% of ionic co-surfactant. The weight ratio of perfume oil to total surfactant is between 0.85 and 2.5, and preferably above 1. The quantity of perfume oil is 0.01-40% w/w, preferably below 35%, of the microemulsion and the quantity of water at least 40% w/w, preferably at least 50%. The microemulsions comprise less than 10% preferably less than 5%, of alcohol. The surfactants are preferably of the nonionic type.

The microemulsions are very suitable for perfuming purposes where the amount of organic solvents should preferably be kept to a minimum, such as for perfuming skin or hair.

The invention also concerns surfactant/perfume mixtures suitable for preparing the clear o/w microemulsions.

AB The present invention relates to a hair treatment preparation and a method of use thereof. The hair treatment preparation is in the form of an oil-in-water emulsion and is preferably used for reducing split ends. The hair treatment preparation contains a lipid soluble ester alcohol or ester polyol and a water-soluble compound selected from panthenol, a panthenol derivative, nicotinic acid amide, a sugar, polyvinyl pyrrolidone or mixtures thereof.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The invention concerns clear o/w microemulsions comprising a perfume oil, an aqueous phase and one or more surfactants with HLB between 9 and 18, and co-surfactants of which at least 0.5% of ionic co-surfactant. The weight ratio of perfume oil to total surfactant is between 0.85 and 2.5, and preferably above 1. The quantity of perfume oil is 0.01-40% w/w, preferably below 35%, of the microemulsion and the quantity of water at least 40% w/w, preferably at least 50%. The microemulsions comprise less than 10% preferably less than 5%, of alcohol. The surfactants are preferably of the nonionic type.

The microemulsions are very suitable for perfuming purposes where the amount of organic solvents should preferably be kept to a minimum, such as for perfuming skin or hair.

The invention also concerns surfactant/perfume mixtures suitable for preparing the clear o/w microemulsions.

AB The present invention relates to a hair treatment preparation and a method of use thereof. The hair treatment preparation is in the form of an oil-in-water emulsion and is preferably used for reducing split ends. The hair treatment preparation contains a lipid soluble ester alcohol or ester polyol and a water-soluble compound selected from panthenol, a panthenol derivative, nicotinic acid amide, a sugar, polyvinyl pyrrolidine or mixtures thereof.

AB Polymer compositions, while providing suitable wrinkle control, also tend to dispense poorly when sprayed. The present invention shows that when viscosity of polymer compositions is minimized spray dispensing improves. Several approaches to minimizing the viscosity of polymer compositions are disclosed. Methods of controlling wrinkles in fabrics comprise treating fabrics with a variety of polymer compositions following a variety of methods. Articles of manufacture comprise (1) a container or substrate, (2) a wrinkle controlling composition, and (3) a set of instructions.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A liquid rinse-added fabric care composition that is characterized by at least two visually distinct phases when the composition is at rest and wherein at least one of the phases contains a fabric care agent is provided. The composition forms a temporary mixture when shaken that allows a consumer to dose a representative sample of the composition and spontaneously re-forms at least two visually distinct phases when allowed to remain at rest. The fabric care agents present in one or more

phases of the composition may include fabric softener actives, color care agents, perfumes, antibacterial agents, malodor control agents, ultraviolet protection agents, anti-abrasion, anti-wear & fabric integrity agents, wrinkle control agents, and mixtures thereof. The composition should also contain less than about 5%, preferably less than about 3%, and even more preferably less than about 1% by weight of detergent actives. The composition optionally may contain an electrolyte, phase stabilizer, a phase separation inducing polymer and/or a solvent. Methods for delivering one or more fabric care benefits to a fabric during a laundering operation using the compositions are also disclosed. Methods for conveying information to a consumer concerning a multi-phase liquid rinse-added fabric care composition are also provided. An article of manufacture comprising a liquid rinse-added fabric care composition that has at least two visually distinct phases and a container that enables a consumer to view the visually distinct phases that are present in the composition is also described. Alternatively, the container may comprise a double walled cap and an insert for removing excess composition that may adhere to the cap.

LINE COUNT:	730	

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The invention concerns clear o/w microemulsions comprising a perfume oil, an aqueous phase and one or more surfactants with HLB between 9 and 18, and co-surfactants of which at least 0.5% of ionic co-surfactant. The weight ratio of perfume oil to total surfactant is between 0.85 and 2.5, and preferably above 1. The quantity of perfume oil is 0.01-40% w/w, preferably below 35%, of the microemulsion and the quantity of water at least 40% w/w, preferably at least 50%. The microemulsions comprise less than 10% preferably less than 5%, of alcohol. The surfactants are preferably of the nonionic type.

10/089,648

The microemulsions are very suitable for perfuming purposes where the amount of organic solvents should preferably be kept to a minimum, such as for perfuming skin or hair.

The invention also concerns surfactant/perfume mixtures suitable for preparing the clear o/w microemulsions.

AB An aerosol antiperspirant or deodorant composition containing, as a non-staining emollient substance or dispersing agent, 2-ethyl-1,3-hexane diol. The compositions may be solutions or suspensions and may contain germicides and antiperspirant agents.

A preferred form of the invention is a powder aerosol antiperspirant composition containing 2-ethyl-1,3-hexane diol as the dispersing agent. The following formulation is typical of such compositions:

	% by weight
Aluminium chlorhydrate	2 to 7.5
Colloidal silica bulking agent	0.05 to 0.75
2-ethyl-1,3-hexane diol	1 to 5
Germicide	up to 0.5
Perfume	0.01 to 2
Aerosol propellant	balance

AB Disclosed are liquid antiperspirant compositions useful for both roll-on and aerosol antiperspirant applications. The compositions have reduced incidence of in-use skin irritation. The compositions comprise from about 10% to about 70%, by weight, of an antiperspirant active material, from about 1% to about 15%, by weight, of a suspension agent, from about 25% to about 75%, by weight, of a non-volatile silicone fluid component, and no more than about 15%, by weight, of volatile silicone fluid. In aerosol embodiments, the compositions can comprise the above composition as a concentrate in combination with an aerosol propellant.

AB Antiperspirant cream compositions, which exhibit reduced residue on the skin and excellent cosmetics and aesthetics, as well as good composition stability over time, are claimed. These compositions, which may be formulated to have relatively high viscosities, include a volatile silicone material, a particulate antiperspirant active, a clay thickening agent, an activator for the clay thickening agent, and a non-volatile paraffinic hydrocarbon fluid, such as mineral oil or branched chain C.sub.16 -C.sub.68 hydrocarbons. A method of treating or preventing perspiration in humans using these compositions is also claimed.

AB Antiperspirant emulsion compositions are described which comprise an aqueous solution of an astringent agent; a volatile, water-insoluble liquid; a polydiorganosiloxane-polyoxyalkylene copolymer; an oil-in-water type surfactant; and a water-in-oil type surfactant. A preferred embodiment comprises an emulsion of aqueous **aluminum** chlorhydrate in cyclopolydimethylsiloxanes as the volatile fluid. These compositions have improved efficacy as measured by their drying times.
